Future Internet Award

Winner:

Architecting the Future Internet

Poznan - October 2011

Future Internet Award

Judges comments *(sample)*

“Trilogy is devoted to propose and to evaluate key control functions of the Internet. The project’s results include architecture, protocols, simulations, prototypes and standardisation at the IETF.”

“Scale of dissemination should be noticed. A lot of effort on standardising results of the project at the IETF should have impact on better traffic management by the network and end-to-end quality of service”

“Good balance between academics and industrials, very open through IETF and other collaborations, has included working test beds of their new protocols”
